

Flagship Labs

Career Growth and Development

2024

**Flagship
Pioneering**

Flagship Pioneering

What is a Career Ladder?

Describes the typical progression from an entry level position to higher levels

Provide clear and consistent descriptions which describe:

- General skills required
- Level of responsibility
- Level of autonomy/authority
- Expectations for how the position will add value to the company

Not specific to a particular functional area, but rather tailored to a specific level within the company

Enable Flagship Labs to better align with peers and industry to effectively compete for the best talent

Not a “checklist” for promotion - promotions are based on what you do, how well you do, behaviors exhibited and business need

What are the Benefits of Having a Defined Career Ladder?

Employees

Develop new skills and competencies at own pace and in current job/job ladder

Clear path to advance to a higher level of responsibility

Understand the gap between current role expectations and future role expectations

Managers

Clear expectations of employees at various roles

Provides managers transparency to have substantive career conversations with their teams

Enables tactical engagement with employees on their professional growth and development.

Organization

Ensures greater consistency and fairness when evaluating new hires, against others already with the company

Aids in the process of monitoring external compensation benchmarks

Illuminates expectations at each level and pathway for development and/or promotions

Career Ladder Progressions

Research Associate Ladder

Research Associate roles focus on technical and analytical proficiency with increasing expectations of critical thinking and working independently.

Research Scientist Ladder

Scientist roles are expected to operate with increasing autonomy and to proactively propose novel methods and solutions of increasing complexity and creativity. They are also expected to hone their leadership and communication skills if they aspire to step into a management position.

Common point to transition to Research Scientist ladder

Management ladder

Common point to transition to Management ladder

**The Sr. Principal Scientist role is reserved for those that will most likely remain on a technical career track.*

Career Ladder Progressions

Engineer Ladder

Management ladder

Common point to transition to
Management ladder

**The Sr. Principal Engineer role is reserved for those that will most likely remain on a technical career track.*

**What does
Career
Development
mean to you?**

Multiple options for development pathways

Multiple options for development pathways

	Small Step	Big Step
Up	Communicating the desire to move up, setting a development plan with incremental goals that support the next steps in that direction	Promotion – moving up in a career pathway or Taking a role outside of the current career pathway ladder
Lateral	Offering services to gain new experience and learning new skills or increase exposure to other parts of the business and increase networks	Broadening knowledge and skills with a either a job change or wider scope in current role. Special projects in function or cross-functionally
Expand	Self-paced learning or focused networking for ongoing development	More responsibility, new challenges and more opportunity for development without changing roles or teams
Explore	Shadowing a senior colleague to understand different areas of the business	Rotations, secondments or short-term job assignments to broaden your experiences
Start Again	Looking for training programs and courses to explore and gauge your interest in this possible new direction	Developing competencies in a new field and changing career paths
New Horizons	Considering stepping into a new stage or pathway and discussing it with trusted advisors or experts to see if you want to take action	Beginning a new stage of your career taking an unexpected opportunities that presented itself though it wasn't on your radar

Experience

Learning by doing:

Identifying on-the-job assignments for enhanced experiences, such as a new project in an area where you don't have much experience, participation on a steering committee, or as a subject matter expert

Exposure

Learning through others:

Informal learning via attendance at industry conferences, coaching and mentoring programs, apprenticeships, employee networks, or working with different colleagues on a project where you have expertise

Education

Learning via formal interventions:

Instruction delivered through facilitator-led classes, lunch and learn, sessions, online learning, interactive video, virtual learning environments, and multimedia courses

Example Employee Development Goal:

I want to master presenting data in a concise and logical format.

1. What **Knowledge, Skills or Behaviors** should you focus on?
2. What **Education, Experience and/or Exposure** opportunities can get you there?
3. How will you commit to **taking action** on your development?

Resources to support this!

3 Step Process for Development Planning

Let's take a closer look at each step...

1. Define your goals

You need to know where you're headed before you can go anywhere. Take time to reflect on where you want to be. Use the questions below as a guide.

Share ideas with a manager, colleague, mentor, or coach for their perspective as well

As you consider the questions below, be specific in your answers

1. What are my strengths, interests, values?
2. What do I want to be doing in 3 years?
3. What do I want to achieve this year?
4. What experiences do I want to have in my career?
5. What skills or abilities do I want to develop?
6. What knowledge would I like to build?

Using the answers to these questions, create some specific, time-bound **development goals**

2. Create an action plan

Now that you have identified what you're going to develop, it's time to figure out **how** you're going to achieve it. Use these guidelines for making an action plan for yourself

Make a list of requirements

What are the specific skills, knowledge, experiences you need to develop to achieve your goal(s)?

If you are looking to move up in the organization, what skills or experiences does the level above you require that you need to develop?

Identify the gap(s)

Compare that list to your current skills, knowledge, experience. What's missing?

Brainstorm action steps

What can you do to close the gap(s)?

Is it learning content, on the job experiences, exposure to new people or situations?

How can you get access to these things?

3. Execute on the plan

Are you going to take on a new project? Go for a certification? Attend a conference? Start a new project that exposes you to a new part of the organization? Whatever actions you put into your goals, it's time to get them done

Determine what **Education, Experience, Exposure** opportunities can help you meet your goals and keep your manager updated on your progress and lean on them if you need more support.

And...Action!

We will be rolling out Development Planning to each company to provide another resource for you to define and own your career in partnership with your manager.

- **Commit to action**
 - Development planning requires partnership and a commitment to check in regularly on progress
- **Gain alignment**
 - Steps to take
 - Specific actions for how to get it done
 - Measurement of success
 - Realistic timelines

Employee: _____
Manager: _____
Review Period: _____ Date of Review: _____

DEVELOPMENT PLAN
(to be prepared by employee in conjunction with manager)

Areas to Develop	Success Indicators	Development Activities	Status/Timing (if applicable)

Promotion Nomination Guidelines

Promotions are formally reviewed twice per year. Approved promotions are made effective on Mar 1 and Sept 1. Promotion nominations can happen throughout the year as needed – for significant changes in scope or role, for example.

Promotion criteria include the following:

- The individual is clearly executing on their goals and delivering value and impact in their current role
- The individual is consistently performing on an ongoing basis, unquestionably sustaining this high performance over time. Should be supported by feedback from peers, colleagues, stakeholders that is consistent with nominating manager
- Promotion to a new level typically results in added responsibility and accountability for the individual's new role
- The nominated employee is viewed as a role model of consistent high performance and their behaviors are respected for modeling our pioneering, entrepreneuring culture

Appendix

High level descriptions for each level

Engineer Ladder: High Level Description

As you move up the ladder, you'll have increasing job responsibilities and autonomy.

Title	Education/Experience*	Scope
Engineer I	BA + 0 YOE	Assists with and may begin to design/ develop technical solutions requiring general technical knowledge and limited business expertise
Engineer II	BA + 2+ YOE Adv deg + 0 YOE	Begins to design/ develop technical solutions in partnership with senior team members, requiring general technical knowledge; begins to develop business experience
Sr. Engineer I	BA + 5+ YOE MS + 3+ YOE PhD + 0 YOE	Independently designs/ develops technical solutions and business process solutions based on business needs requiring specialized technical knowledge; deepens business expertise
Sr. Engineer II	BA + 8+ YOE MS + 6+ YOE PhD + 3+ YOE	Performs advanced designs/ developments for technical solutions, supporting and implementing moderately complex to complex processes based on understanding of business need
Principal Engineer	BA + 12+ YOE MS + 9+ YOE PhD + 5+ YOE	Performs expert development, support and implementation of complex processes using specialized technical knowledge and highly developed business expertise
Sr. Principal Engineer	BA + 15+ YOE MS + 12+ YOE PhD + 8+ YOE	Designs and evaluates highly complex engineering processes and improvements, supports the development of highly complex processes using in-depth technical expertise and understanding of the company's strategic engineering/technical objectives and activities

Common point to transition to Management ladder, if applicable

* Years of Experience ranges are intended to be used as an initial guideline in conjunction with all other leveling criteria and are not to be used as the only point of leveling evaluation

Management Ladder: High Level Description

Title	Complexity	Scope
Manager	Manages operational initiatives	• Experienced individual contributor; Works collaboratively across disciplines • Interacts with supervisors, customers, and/or professionals
Sr. Manager	Establishes goals based on objectives	• May manage or guide a team of individual contributors; effectively collaborates across disciplines • Interacts with lower and/or senior management • Applies knowledge to convince stakeholders
Assoc. Director	Establishes objectives and assignments	• Manages or guides a team of individual contributors; promotes and models collaboration across disciplines; begins to lead development of team • Interacts with senior management • Communicates persuasively to gain acceptance of others in sensitive situations
Director	Translates strategy into functional plans	• May direct through first-line managers, responsible for development of managers and subject matter experts • Interacts with senior management, executives, major customers • Drives business results
Sr. Director	Provides strategy and direction for multiple areas	• Manages a team of directors and/ or high-level individual contributors, responsible for development of directors and subject matter experts • Interacts with internal and external executives; Influential leader

Scientific Ladder: High Level Description

As you move up the ladder, you'll have increasing job responsibilities and autonomy.

Common point to transition to Research Scientist ladder, if applicable

Common point to transition to Management ladder, if applicable

Title	Education/Experience*	Scope
RA I	BA + 0 YOE Entry level	Under supervision during training period, gradual movement to directional guidance and contributions to experiments that support research activities
RA II	BA + 2+ YOE MS + 0 YOE	Under limited supervision, leads experiments that support research activities consulting supervisor on project steps when question arise; consults with supervisor when developing methods and designing experiments
Sr. RA	BA + 5+ YOE MS + 3 YOE	Designs and executes experiments that support established research steps, methodologies, and project goals
Associate Scientist	BA + 8+ YOE MS + 6+ YOE	Plans and executes assigned experiments that support new research activities, methodologies, and project goals
Scientist I	BS + 10+ YOE MS + 8+ YOE PhD + 0 YOE	Responsible for conducting small to moderate scope research and experiments
Scientist II	BS + 12+ YOE MS + 10+ YOE PhD + 2+ YOE	Responsible for conducting moderate scope research and experiments
Sr. Scientist I	BS + 14 YOE MS + 12+ YOE PhD + 5+ YOE	Responsible for conducting moderate to large scope research and experiments and directing and managing day-to-day research
Sr. Scientist II	BS + 16+ YOE MS + 14+ YOE PhD + 8+ YOE	Responsible for conducting large scope research and experiments and directing day-to-day research
Principal Scientist	BS + 18+ YOE MS + 16+ YOE PhD + 12+ YOE	Responsible for conducting significantly large and impactful research and experiments; plans, designs, and directs day-to-day research
Sr. Principal Scientist	BS + 20+ YOE MS + 18+ YOE PhD + 16+ YOE	Initiates, directs and executes the scientific research and/or development direction for a company; investigates the feasibility of applying a wide variety of scientific principles and concepts

Scientific Research Associate Leveling Guide

Detailed descriptions for each level

Scientific – Research Associate

Company Title	Research Associate I	Research Associate II	Senior Research Associate	Associate Scientist
Radford Level	Research Associate 1 (RA1)	Research Associate 2 (RA2)	Research Associate 3 (RA3)	Research Associate 4 (RA4)
Scope	- Under supervision during training period, gradual movement to directional guidance and contributions to experiments that support research activities - Operates scientific research equipment, follows appropriate methods and techniques to perform experiments and contributes to related research reports - May proactively seek out senior research associates to discuss potential solutions to problems - Begins to develop skills in data analysis and ability to evaluate quality of data - Shows positive attitude throughout prescribed changes to work being done; learns how to prioritize work	- Under limited supervision, leads experiments that support research activities consulting supervisor on project steps when question arise; consults with supervisor when developing methods and designing experiments - Begins to recommend alternatives, research new methods and techniques, and may proactively seek out senior team members to discuss potential solutions to problems - Develops skills in data analysis and ability to evaluate quality of data - Approaches work flexibly and with a positive attitude; recognizes when priorities are changing and understands the need for their work to change - Assists with the training for new research associates, supports new research associates with questions	- Designs and executes experiments that support established research steps, methodologies, and project goals - Recommends alternatives, critically researches new methods and techniques, and proactively seeks out senior team members to discuss potential solutions to problems - Develops and onboards new techniques for the company - Conducts data analysis and can evaluate quality of data - Anticipates and recognizes change in priorities and understands the impact on deliverables - Leads training for new research associates, serves as a technical resource within the team	- Plans and executes assigned experiments that support new research activities, methodologies, and project goals - Thinks critically and works independently in the determination of new methods and techniques; proactively collaborates with associate scientists, scientists, and senior team members to discuss potential solutions to problems - Applies technical expertise, skills, and wisdom to experiment design, beginning to build scientific expertise - Confidently drives scientific thinking by maintaining familiarity with scientific literature, asking scientific questions, and applying knowledge appropriately to research projects - Anticipates and recognizes changes in priorities and acts as needed; looks for opportunities arising out of changing parameters
Functional Knowledge	- Limited use and/ or application of scientific principles, theories, and concepts at start of career - Begins to recognize patterns or inconsistencies in research data results - Deduces meaningful results while conducting routine analyses or troubleshooting minor issues; begins to think beyond the routine processes and considers the impact decisions have on the broader scientific goals - Independently plans basic research experiments applicable to a specific project	- Understanding of scientific principles, theories, and concepts - Consistently recognizes patterns, anomalies, or inconsistencies in research data results and begins to troubleshoot solutions and interpret experimental outcomes - Begins to think beyond the routine processes and considers the impact decisions have on the broader scientific goals as well as cross-disciplinary goals - Independently plans moderately complex research experiments applicable to a specific project - Solution focused based on business needs, pulled in to solve problems	- Advanced understanding of scientific principles, theories, and concepts - Consistently recognizes anomalous and inconsistent results and interprets experimental outcomes - Explains the process behind the data and broader implications of the results on cross-disciplinary goals - Independently plans complex research experiments applicable to a specific project - Begins to establish recognition as a technical expert, possibly in multiple techniques or specialty areas	- Complete understanding of relevant scientific principles, theories, and concepts and its impact on broader cross-disciplinary initiatives - Independently plans and executes wider array of experiments that support new research and development activities and project goals - Demonstrates technical proficiency and scientific creativity within scientific discipline
Job Complexity	- Serves as a data resource through completion of lab work for minimally to moderately complex projects - Able to learn, perform and deliver findings on a minimally to moderately large scale, supplementing	Serves as a data resource through completion of lab work and generation of data for moderately complex projects; may begin to provide data insights	- Serves as a dedicated resource for complex projects; may begin to oversee other research associates in the gathering and analyzing of data - Selects appropriate methods and techniques to complete complex procedures, analyses, and research	Works on complex problems where analysis of situations or data requires comprehensive evaluation of many unknown factors; interprets and analyzes data from scientific experiments for both accuracy and impact

Scientific – Research Associate

Company Title	Research Associate I	Research Associate II	Senior Research Associate	Associate Scientist
Radford Level	Research Associate 1 (RA1)	Research Associate 2 (RA2)	Research Associate 3 (RA3)	Research Associate 4 (RA4)
	procedures, analyses, and research experiments to a subset of the project team Uses established data, reports, and previous results to solve common issues; identifies inappropriate variances and concerns and reports all inconsistent results to supervisor	- Selects appropriate methods and techniques to complete moderately complex procedures, analyses, and research experiments - Able to learn, perform and deliver findings on moderately complex procedures, analyses, and research experiments to project teams and begin to share - Uses established data, reports, and previous results to solve semi-routine issues; recognizes fundamental anomalies in data points and identifies issues in experiments, sharing uncommon inconsistencies with supervisor	experiments; recommends alternative methods/ techniques and pays close attention to appropriate processes within the disciplinary area - Consistently recognizes anomalies and inconsistent results and interprets research experimental outcomes, sharing only the most uncommon and rare inconsistent findings with supervisor - Independently executes array of scientific experiments that support both new research and development activities as well as project goals within scientific discipline	- Independently executes wider array of scientific experiments that support both new research and development activities as well as project goals that support cross-disciplinary teams - Evaluates and recommends alternative methods/ techniques within and across disciplinary areas; serve as subject matter expert in technical expertise with broad latitude in problem resolution - Begins to demonstrate scientific expertise in a particular area
Discretion and Decision Making	- Receives detailed instruction and supervision on new components of project work; supervisor offers guidance on data/ output - Applies entry level research skills to projects or assignments within own group/ project team	- Receives general guidance on established and new tasks; interacts with supervisor regularly but operates with more independence at this level - Applies intermediate level research skills to projects or assignments within own group/ project team	- Receives limited guidance and supervision on experiments and projects; interacts with supervisor as needed, but able to operate independently within own area - Recommends alternatives, researches new methods and techniques, and proactively seeks out senior team members to discuss potential solutions to problems	- Determines own methods and procedures on new projects; interacts as needed with supervisor, with minimal instruction needed on existing protocols; may provide task management to junior research associates - Takes a new perspective on existing solutions and exercises judgment in confirming a final decision, displays early capabilities in reviewing data and making appropriate recommendations
Interaction and Collaboration	- Interacts primarily within the scientific team - Understands importance of building relationships - Learns dynamics of direct team and begins building relationships within direct team; contributes to team projects when work is directly assigned and mostly to support team projects - Independent work leads to broader team/ cross-discipline interactions	- Begins to establish relationships with junior research associates within the group; may begin training new employees within and across teams; begins to serve as a resource to other team members in a small number of areas - Begins to devote time and effort to building relationships, looks for ways to provide support, and begins to leverage expertise and contacts to solve problems or gain knowledge - Works on and helps with tactical work within team, gaining an understanding of how the team operates; attends meetings and meets new people cross-disciplinary	- Begins to establish recognition with junior research associates as a technical resource within the group, may begin to act as a mentor - Begins to develop networks that are diverse in level and discipline, identifies and initiates new relationships as well as creative alliances to accomplish business objectives, and inspire colleagues with diverse needs to work together for mutual benefit - Can assist other team members in a small number of areas and learns additional knowledge cooperatively, contributing occasionally to cross-disciplinary work	- Acts as a resource for other research associates within the department; keeps colleagues apprised of scientific projects and status independently and appropriately, acts as a mentor for junior research associates, co-op interns, and other associates across disciplines - Consistently develops networks that are diverse in level and discipline, identifies and initiates new relationships as well as creative alliances to accomplish team objectives, and inspires colleagues with diverse needs to work together for mutual benefit - Can assist other team members in a broader number of areas and learns additional knowledge cooperatively - Builds influence by presenting new ideas; contributes to cross-disciplinary work - May work independently with external vendors or collaborators
Innovation and Creativity	Participates in continuous learning, critical thinking, and interpersonal communication to enhance the team and overall project	Partners with senior research associates, scientists, and senior scientists on the development of new and unique scientific and technical ideas	- Develops new and unique scientific and technical ideas - Begins to develop creative ways to solve for multiple components of respective scientific process, sharing	- Continuously implements diverse perspective to promote innovation in scientific discipline(s) - Develops creative means to solve for issues in area of scientific expertise, sharing with broader department

Scientific – Research Associate

Company Title	Research Associate I	Research Associate II	Senior Research Associate	Associate Scientist
Radford Level	Research Associate 1 (RA1)	Research Associate 2 (RA2)	Research Associate 3 (RA3)	Research Associate 4 (RA4)
	Innovative mindset as focus is on building core expertise through understanding the why and advancing the project	May begin to develop creative ways to solve for one component of respective scientific process, sharing with immediate team	with immediate team and may begin to share with cross-disciplinary teams	and/ or cross-disciplinary team; begins to focus on innovative approaches to cross-disciplinary processes, impacting various interdependent workstreams
Education / Experience (Guideline only)	- Typically requires a BS degree in relevant scientific discipline with 0-2 years of industry experience - Academic experience including co-ops and internships count toward degree and not work experience	- Typically requires a BS degree in relevant scientific discipline with 2+ years industry experience; or a Master's degree in relevant scientific discipline with 0-2 years of industry experience - Academic experience including co-ops and internships count toward degree and not work experience	- Typically requires a BS degree in relevant scientific discipline with 5+ years industry experience; or a Master's degree in relevant scientific discipline with 3+ years of experience - Academic experience including co-ops and internships count toward degree and not work experience	- Typically requires a BS degree in relevant scientific discipline with 8+ years industry experience; or a Master's degree in relevant scientific discipline with 6+ years of experience - Academic experience including co-ops and internships count toward degree and not work experience

Scientific Scientist Leveling Guide

Detailed descriptions for each level

Scientific - Scientist

Company Title	Scientist I	Scientist II	Senior Scientist I	Senior Scientist II	Principal Scientist	Senior Principal Scientist
Radford Level	Scientist 1 (T1)	Scientist 2 (T2)	Scientist 3 (T3)	Scientist 4 (T4)	Scientist 5 (T5)	Scientist 6 (T6)
Scope	- Responsible for conducting small to moderate scope research and experiments - Begins to apply scientific principles and techniques to scientific programs and projects - Works under supervision of more senior scientists to advance the development of economical (e.g., budget and CRO management), state-of-the art scientific techniques - May begin to contribute to scientific literature and attend conferences	- Responsible for conducting moderate scope research and experiments - Applies scientific principles and techniques to scientific programs and projects - Works in collaboration with more senior scientists or scientific directors to advance the development of economical (e.g., budget and CRO management), state-of-the art scientific research and techniques - Contributes to scientific literature through consulting, writing, and conference attendance	- Responsible for conducting moderate to large scope research and experiments and directing and managing day-to-day research - Begins to investigate the feasibility of applying advanced scientific principles and techniques to scientific programs and projects - Recommends economical (e.g., budget and CRO management), state-of-the art scientific research and techniques - Makes contributions to scientific literature through publication and conference attendance - Begins to act as a spokesperson, internal consultant, and/ or advisor to senior management on corporate research and development direction	- Responsible for conducting large scope research and experiments and directing day-to-day research - Investigates the feasibility of applying advanced scientific principles and techniques to scientific programs and projects - Begins to advance the development of economical (e.g., budget and CRO management), state-of-the art scientific research and techniques - Makes major contributions to scientific literature through publication, conference attendance, and may present research results at conferences - Act as a spokesperson, internal consultant, and/ or advisor to leadership on corporate research and development direction; serves as a mentor to direct reports and others within scientific discipline, developing trust	- Responsible for conducting significantly large and impactful research and experiments; plans, designs and directs day-to-day research - Determines the feasibility of applying advanced scientific principles and techniques to scientific programs and projects, ensuring alignment with the company's objectives and advancement of scientific discovery - Consistently advances the development of economical (e.g., budget and CRO management), state-of-the-art research and aligned with the company's strategic research objectives - Considered thought leader in industry through significant impactful contributions to scientific literature and conferences through publication and presentation of research findings - Act as a spokesperson, internal consultant, and/or advisor to leadership on corporate research and development direction; serves as expert resource to the scientific community at large	- Responsible for initiating, directing and executing the scientific research and/or development direction for a company through a research staff (or independent study) - Spearheads determining the feasibility of applying advanced scientific principles and techniques to scientific programs and projects, ensuring alignment with the company's objectives and advancement of scientific discovery - Responsible for advancing the development of economical (e.g., budget and CRO management) state-of-the-art research aligned with the company's strategic research objectives - Recognized as a published expert within a discipline - Influences senior management to adopt a different point of view, when appropriate, and make decisions that have an impact on business direction and corporate strategies
Job Complexity	Evaluates multiple factors to solve minimally to moderately complex problems	Works on moderately complex problems where analysis of situations or data requires	Works on moderately complex problems and begins working on complex problems where analysis of situations or data requires	Works on complex problems that impact the success of current therapies or addresses	Works on significantly complex and unique issues where analysis of situations or data requires an evaluation of intangible variables	Responsible for leading evaluation on significantly complex and unique issues where analysis of situations or data involves

Scientific - Scientist

Company Title	Scientist I	Scientist II	Senior Scientist I	Senior Scientist II	Principal Scientist	Senior Principal Scientist
Radford Level	Scientist 1 (T1)	Scientist 2 (T2)	Scientist 3 (T3)	Scientist 4 (T4)	Scientist 5 (T5)	Scientist 6 (T6)
	Exercises judgment within defined procedures and practices to determine appropriate action	evaluation of some intangible variables - Exercises judgement to solve for a diverse scope of problems, within generally defined practices and policies in selecting methods and techniques for obtaining solutions	independent judgement and evaluation of intangible variables - Exercises judgment within broadly defined practices and policies in selecting methods, techniques, and evaluation criteria for obtaining results - Seeks continual improvement of work practices from experience and contributes to the advancement of existing methods and protocol	broad issues of pipeline products or research processes - Successfully plans, executes, and oversees complex projects/ initiatives requiring independent judgment in the evaluation, selection, and substantial adaptation/ modification of standard techniques, procedures, and criteria - Devises new approaches to problems encountered; uses a wide application of complex principles, theories, and concepts in the scientific discipline - Partners with senior management in making strategy decisions around scientific discipline - Applies advanced scientific analytical thought and scientific experience to identify and solve for highly complex issues	and may impact future concepts or solutions - Exercises wide latitude in determining objectives and approaches to critical research aligned to The company's strategic priorities - Leads diverse resources to plan and execute multi-discipline scientific projects - Partners with leadership in development of The company scientific strategy - Applies advanced scientific analytical expertise and judgment, solving for significantly complex issues	intangible variables and may impact future concepts or solutions - Leads the scientific team in determining objectives and approaches to critical research, influencing The company's strategic priorities - Leads diverse resources to plan and execute multi-discipline scientific projects with a significant impact on company direction - Influences leadership on development and implementation of The company scientific strategy - Applies advanced scientific analytical leadership and judgment, solving for significantly complex issues that have an impact on business direction
Functional Knowledge	- Understands how to build processes that are robust and understands how they may impact future processes and fit into the company's scientific and business goals - Maintains general working knowledge of scientific principles and theories, applying such knowledge to the research direction that supports the company's interests - Demonstrates technical proficiency and scientific creativity within scientific discipline; provides	- May develop an understanding of other cross-disciplinary areas and related dependencies - Maintains broad knowledge of scientific principles and theories and possesses intellectual understanding of one or more scientific area - Begins to deepen working knowledge of scientific principles and theories, applying such knowledge to the research direction that supports The company's interests	- Applies understanding of the team's role in the larger company, and discusses changes, progress, and issues as they relate to other areas - Maintains substantial knowledge of scientific principles and theories and acts as a technical lead on various projects, applying such knowledge to the research direction that supports The company's interests - Begins to utilize working knowledge of other related	- Contributes to The company's scientific strategy by recommending projects to pursue; assesses pros and cons of proposed alternatives - Maintains in-depth knowledge of principles and theories, broadening understanding of applying such knowledge to the research direction that supports and directly influences The company's interests - Consistently utilizes working knowledge of other related disciplines within The company to	- Influences the direction of the scientific function and in turn guides The company's research strategy - Maintains extensive knowledge of principles and theories, applying such knowledge to the operational management and direction of the scientific function in support of The company's research and strategic business interests - Taking a strategic view, contributes to multiple areas of	- Investigates the feasibility of applying a wide variety of scientific principles and concepts to potential inventions, products and problems - Maintains broad knowledge of state-of-the-art principles and theory, and uses this knowledge to influence company research and strategic business interests - Makes major contributions at a national or multinational level to scientific literature and conferences

Scientific - Scientist

Company Title	Scientist I	Scientist II	Senior Scientist I	Senior Scientist II	Principal Scientist	Senior Principal Scientist
Radford Level	Scientist 1 (T1)	Scientist 2 (T2)	Scientist 3 (T3)	Scientist 4 (T4)	Scientist 5 (T5)	Scientist 6 (T6)
	overview and interpretation of data and insights to next steps Defends results and interprets finding in formal settings including cross-disciplinary team meetings		disciplines to provide solutions to a wide range of difficult problems Begins to be perceived as a subject matter expert as it relates to company goals and strategy	provide solutions to a wide range of difficult problems Perceived as a subject matter expert as it relates to company goals and strategy	therapeutic research with company and industry-wide impact Perceived as an industry subject matter expert as it relates to scientific area	Recognized as the internal and external expert as it relates to scientific area
Discretion and Decision Making	- Normally receives minimal instructions on routine work, detailed instructions on new assignments; interacts as needed with supervisor - Uses own scientific judgment to apply and adapt standard methods and techniques with increased independence by applying prior research and/ or work experience - Works within general scientific guidelines and policies - Can identify a solution to most issues, though escalates as appropriate with a proposed comprehensive solution - May begin to manage a team of junior research associates	- Normally receives minimal instructions on routine work, general instructions on new assignments - Uses broader discretion on routine task; exercises moderate judgement in moderately complex research projects - Work is guided by scientific and functional policies - Advises research associates, associate scientists, or members of project teams in the initiation and execution of scientific experimentation to collectively achieve team goals - May manage a team of junior research associates	- Receives no instructions on routine work, no to minimal instructions on new assignments - Determine methods and procedures on new assignments and may provide guidance to other junior scientists - Independently evaluates, selects, and applies standardized scientific procedures and techniques to moderately complex to complex assignments - Provides direction to research associates/ junior scientists or members of project teams in the initiation and execution of scientific experimentation, considering economic and safety factors to collectively achieve team goals - May begin to manage a team of research associates/ junior scientists - May be promoted into the scientific management track as an Associate Director, responsible for people management of a team of senior level research associates and scientists	- Efficiently and proactively completes routine work and new assignments with no instructions - Devises new approaches to problems encountered; uses a wide application of complex principles, theories, and concepts within scientific discipline - Independently determines and manages research projects including communication of how individual tasks contribute to larger The company goals; anticipates problems that may arise as part of assignments - May manage a team of senior level research associates and scientists - May move into scientific management track as an Associate Director, responsible for people management of a team of senior level research associates and scientists - Partners with senior management, influencing the direction of the scientific function and in turn guides The company's strategy	- Proactively and independently acts to determine methods and procedures on new and highly complex assignments - Plans, oversees, and directs multiple highly complex research programs or projects and coordinates research and development activities between disciplines - Impacts scientific business direction and strategy through the development of innovative methodologies and processes - May manage a team of scientists - May move into scientific management track as a Director, responsible for people management of a team of scientists - Partners with leaders, influencing the direction of the scientific function and in turn guides The company's strategy - Serves as a strategic leader within The company, a reputable internal	- Proactively and with a high level of discretion, acts to determine methods on new and highly complex assignments - Contributions consistently result in company-wide business or process improvements, with decisions having a significant long-term impact (5+ years) - Guided by functional strategy, decisions impact overall success of functional or company-wide operations - Influences scientific business direction and strategy through the development of innovative methodologies and practice - May manage a team of scientists - Influences senior management and has a significant impact on the scientific function and The company's strategy - Has a significant impact within scientific discipline both internally and externally, seen as subject matter expert

Scientific - Scientist

Company Title	Scientist I	Scientist II	Senior Scientist I	Senior Scientist II	Principal Scientist	Senior Principal Scientist
Radford Level	Scientist 1 (T1)	Scientist 2 (T2)	Scientist 3 (T3)	Scientist 4 (T4)	Scientist 5 (T5)	Scientist 6 (T6)
			▪ Begins to partner with management, influencing the direction of the scientific function and in turn guides The company's strategy		and external subject matter expert within scientific discipline	
Interaction and Collaboration	▪ Participates in cross-disciplinary team; begins to serve as a technical resource and mentor for junior research associates ▪ Builds effective working relationships within team, company, and external vendors/ collaborators to achieve goals ▪ Participates in scientific meetings and may lead discussions around areas of expertise	▪ Contributes to cross-disciplinary team; serves as a technical resource and mentor for junior research associates ▪ Builds effective working relationships within department and with external vendors/ collaborators to achieve goals ▪ Develops networks that are diverse in level, discipline, and function, may identify and initiate new relationships as well as creative alliances to accomplish business objectives	▪ Provides direction on cross-disciplinary teams, setting timelines and assessing results against key milestones; serves as a technical resource and mentor for research associates/ junior scientists ▪ Builds effective cross-disciplinary working relationships to achieve goals; builds relationships with external vendors/ collaborators ▪ Consistently develops networks that are diverse in level, discipline, and function, identifies and initiates new relationships as well as creative alliances to accomplish business objectives; beings to inspire and motivate employees with diverse needs to partner for mutual benefit ▪ Begins to serve as a resource/ advisor to management on scientific strategy by recommending projects to pursue; assesses pros and cons of proposed alternatives	▪ Leads cross-disciplinary projects that require successful collaboration at the highest levels; serves as a technical resource and mentor for senior level research associates and junior scientists ▪ May work with or manage external vendors (e.g., CRO) or collaborators independently as needed ▪ Consistently models, trains, and motivates multiple levels of employees to be exceptional collaborators; inspires them to work together for mutual benefit ▪ May serve as a resource/ advisor to management and leaders on scientific strategy by recommending projects to pursue; assesses pros and cons of proposed alternatives ▪ "Trusted advisor" within scientific discipline where guidance is sought from leadership in times of change	▪ Inspires, guides, and advises significant cross-disciplinary scientific projects that require successful collaboration within the highest levels; serves as a technical resource and mentor for scientists ▪ Promote collaboration across scientific disciplines and inspires an environment where everyone can work by The company's mission and vision ▪ Builds relationships within and outside of The company, devoting time and effort to maintaining a broad network of relationships; initiates creative business alliances to accomplish business objectives or execute strategy ▪ "Trusted advisor" within scientific function and across The company where guidance is sought from leadership in times of change	▪ Leads significant cross-disciplinary scientific projects that require successful collaboration within the highest levels; serves as a technical resource for scientists and leaders ▪ Boosts collaboration across scientific disciplines and creates an environment where everyone can work by The company's mission and vision ▪ Establishes and maintains significant relationships within and outside of The company, devoting time and effort to maintain a broad network of relationships; initiates creative business alliances to accomplish business objectives or execute strategy ▪ "Trusted advisor" to company leadership and the organization
Innovation and Creativity	▪ Proactively takes appropriate risks to deliver scientific success ▪ Initiates limited creative means to solve for overall scientific process issues; begins to focus on innovative approaches to cross-disciplinary processes	▪ Develops and creates novel processes and hypotheses using new ideas and knowledge ▪ Broadens creative means to solve for scientific process issues; focuses on innovative approaches to cross-disciplinary processes	▪ Recognizes the need for scientific creativity and innovation; assesses risks for utilizing novel, out of the box methodologies/ processes ▪ Consistently utilizes creative means to solve for scientific process issues, drives innovative	▪ Recognized as champion, explores, and approaches unconventional scientific and technical innovations with innovative mindset ▪ Consistently utilizes creative means to solve for issues	▪ Generates strategic vision for innovation, inspiring others to embrace creativity for The company to achieve breakthrough results ▪ Expertly utilizes creative means to solve for varied issues across	▪ Owns the strategic vision for innovation, encourages others to embrace creativity for The company to achieve breakthrough results ▪ Expertly utilizes creative means to solve for significantly complex

Scientific - Scientist

Company Title	Scientist I	Scientist II	Senior Scientist I	Senior Scientist II	Principal Scientist	Senior Principal Scientist
Radford Level	Scientist 1 (T1)	Scientist 2 (T2)	Scientist 3 (T3)	Scientist 4 (T4)	Scientist 5 (T5)	Scientist 6 (T6)
			approaches to cross-disciplinary processes	pertaining to scientific processes and cross-disciplinary practices impacting results ▪ Begins to be perceived as innovative internal "think-tank" for The company's scientific disciplines	cross-disciplinary practices impacting scientific process results ▪ Perceived as innovative internal and external "think-tank" for The company's scientific disciplines	issues across cross-disciplinary practices impacting organization-wide results ▪ Perceived both within the company and externally as the innovative "think-tank" for the industry
Education / Experience <i>(Guideline only)</i>	▪ Typically requires a BS degree in relevant scientific discipline with 10+ years industry experience; a Master's degree in relevant scientific discipline with 8+ years of experience; or a PhD with 0+ years of experience	▪ Typically requires a BS degree in relevant scientific discipline with 12+ years industry experience; a Master's degree in relevant scientific discipline with 10+ years of experience; or a PhD with 2+ years of relevant experience	▪ Typically requires a BS degree in relevant scientific discipline with 14+ years industry experience; a Master's degree in relevant scientific discipline with 12+ years of experience; or a PhD with 5+ years of relevant experience	▪ Typically requires a BS degree in relevant scientific discipline with 16+ years of relevant experience, a Master's degree in relevant scientific discipline with 14+ years of experience, or a PhD with 8+ years of relevant experience	▪ Typically requires a BS degree in relevant scientific discipline with 18+ years of relevant experience, a Master's degree in relevant scientific discipline with 16+ years of experience, or a PhD with 12+ years of relevant experience	▪ Typically requires a BS degree in relevant scientific discipline with 20+ years of relevant experience, a Master's degree in relevant scientific discipline with 18+ years of experience, or a PhD with 16+ years of relevant experience

Engineering Leveling Guide

Detailed descriptions for each level

Engineering - Professional

Company Title	Engineer I	Engineer II	Senior Engineer I	Senior Engineer II	Principal Engineer	Senior Principal Engineer
Radford Level	Professional 1 (P1)	Professional 2 (P2)	Professional 3 (P3)	Professional 4 (P4)	Professional 5 (P5)	Professional 6 (P6)
Scope	- Assists with and may begin to design/ develop technical solutions requiring general technical knowledge and limited business expertise - Supports projects based on specific instructions and with limited discretion - Under regular instructions and supervision, begins to troubleshoot technical issues, making general decisions within standard parameters for engineering/ technical processes and protocols - Develops an understanding of industry and The company-specific quality standards	- Begins to design/ develop technical solutions in partnership with senior team members, requiring general technical knowledge; begins to develop business experience - Supports projects within own team with limited resource requirements, risk, and/ or complexity - Analyzes technical issues and makes decisions within minimally complex parameters under general supervision with further instructions as needed - Understands quality standards and work requires minimal revision	- Independently designs/ develops technical solutions and business process solutions based on business needs requiring specialized technical knowledge; deepens business expertise - Acts as technical lead within own team/ project within engineering/ technical function for projects or programs with moderate resource requirements, risk, and/ or complexity - Analyzes and evaluates technical issues and makes decisions within moderately complex parameters under limited supervision - Focuses on quality in all aspects of work; follows established standards of excellence	- Performs advanced designs/ developments for technical solutions, supporting and implementing moderately complex to complex processes based on understanding of business need - Acts as technical lead for one or more teams/ projects within engineering/ technical function for projects or programs with moderate to complex resource requirements, risk and/ or complexity - Researches industry trends and prepares feasibility studies for improvements to moderately complex to complex processes - Demonstrates standards to deliver high-quality results; sets high standards for self and others	- Performs expert development, support and implementation of complex processes using specialized technical knowledge and highly developed business expertise - Acts as technical lead for large and/ or multiple teams within engineering/ technical function for projects or programs with high resource requirements, risk and/ or complexity - Evaluates technology effectiveness/ data interoperability of complex processes, influencing The company roadmap - Raises the bar and drives others to deliver high-quality results; recommends new standards of excellence	- Gated entry exists at this level; may require approval by leadership or technical committee - Supports the development of highly complex processes using in-depth technical expertise and understanding of The company's strategic engineering/ technical objectives and activities - Acts as technical lead for large programs and initiatives with significant resource requirements, evaluation of risk, and/ or complexity - Designs and evaluates highly complex engineering processes and improvements based on understanding of The company needs - Establishes excellence criteria standards with the ability to drive them forward
Job Complexity	- Works on assignments and problems/ projects of limited scope requiring judgment and initiative, using standard prescribed practices and procedures - Follows standard practices and procedures in completing analysis or tasks	- Works on minimally to moderately complex problems/ projects that require analysis of data; depending on project may have the opportunity to lead project or method development - Exercises judgment within defined procedures and practices to determine appropriate actions or to recommend alternative resolutions - May define technical policies for project/ programs	- Works on moderately complex problems/ projects and considers relative value of several alternative solutions to potential issues before confirming a final decision as to the path forward - Adopts and implements business and process improvements within respective area of expertise - May oversee lower-level team members in the gathering and analyzing of data	- Solves moderately complex to complex problems, identifying viable options; uses analytical skills and judgment to recommend innovative solutions - Helps drive processes and manage projects, acting as technical lead within respective discipline, taking ownership of timelines and completion - May begin to lead the day-to-day work of lower-level team members within own team	- Uses sophisticated analytical thought to exercise judgment in identifying innovative solutions and solving for complex problems - Drives processes and manages projects, leading complex projects of diverse scope where analysis requires an understanding of current business trends - May lead the day-to-day work of lower-level team members within own team	- Identifies and resolves unique, highly complex situations of substantial significance in field of expertise - Allocates resources and creativity to problem analysis and resolution in complicated and/ or novel situations - May lead/ mentor the day-to-day work of lower-level team members within own team

Engineering - Professional

Company Title	Engineer I	Engineer II	Senior Engineer I	Senior Engineer II	Principal Engineer	Senior Principal Engineer
Radford Level	Professional 1 (P1)	Professional 2 (P2)	Professional 3 (P3)	Professional 4 (P4)	Professional 5 (P5)	Professional 6 (P6)
		- May begin to oversee lower-level team members in the gathering and analyzing of data - May begin to participate in cross-functional initiatives	May participate in cross-functional initiatives depending on projects/ programs	Participate in cross-functional initiatives	May participate in company-wide strategic initiatives	Participates in company-wide strategic initiatives
Functional Knowledge	- Requires some hands-on experience in engineering techniques relevant to position - Uses prior knowledge/ experience of technology or similar tools used in engineering development - Exchanges straightforward information, asks questions and checks for understanding	- Requires some experience in engineering while working to acquire higher-level knowledge and technical skills - Comfortable with engineering technology, tools, and processes - Solves a range of unique problems and explains logic or decisions to others; begins to analyze multiple sources of information and evaluates several alternative solutions before suggesting path forward	- Requires understanding of the processes and procedures used to accomplish the work and recognition of impact on other disciplines - Proficient with engineering development technology, tools, and processes - Analyzes multiple sources of information and evaluates several alternative solutions before suggesting path forward	- Requires advanced engineering knowledge and working knowledge of interdependent disciplines - Begins to apply understanding of best practices in development and how own function contributes to the achievement of objectives - Leads others to solve problems; uses advanced analytical thought to improve development technology, tools, and processes	- Requires specialized engineering knowledge and working knowledge of interdependent disciplines - Applies understanding of best practices in the engineering industry and how own function contributes to the achievement of company-wide objectives - Leads others to solve complex problems; uses sophisticated analytical thought to exercise judgment and implements innovative solutions	- Recognized as the internal and external technical expert at The company - Requires broad and comprehensive expertise in leading-edge theories, techniques and/ or technologies within the industry - Applies creativity to problem analysis and resolution in complicated and/ or novel situations
Discretion and Decision Making	- Impact primarily extends to own team but may begin to interact with other areas of The company as part of process workflow - Makes decisions that have immediate impact - Work may be pre-determined; may receive detailed instructions on work or may need to fall back functional knowledge	- Impacts own team and other teams whose work activities are closely related - May suggest improvements to existing processes and solutions to improve the efficiency of the team - Makes decisions that have short-term impact (less than 6 months) - Normally receives assignments from management level and receives general instructions on routine work, minimal instructions on new projects or assignments	- Decisions impact the quality, efficiency, and effectiveness of own team - May impact closely related teams through quality of output - Makes decisions that have a short-term impact (6 months to 1 year) - Normally receives minimal guidance on day-to-day work, minimal instructions on new assignments	- Decisions impact the achievement of quality, operational, or program objectives of the function - Contributions may result in cross-functional business or process improvements - Makes decisions that have a medium-term impact (1 to 2 years) - Determines methods and procedures on new assignments and may coordinate activities of junior technical staff	- Decisions impact the direction of and resource allocation for the broader functional operations - Understands the interdependencies of technical and business changes, often resulting in company-wide business or process improvements - Makes decisions that have a long-term or multi-year impact (3+ years) - Acts independently to determine methods and procedures on new or special assignments	- Drives future technology roadmap and influences The company direction across multiple functions - Guided by functional strategy, decisions impact overall success of functional or company-wide operations - Contributions consistently result in company-wide business or process improvements, with decisions having a significant long-term impact (5+ years) - Proactively and with a high level of discretion, acts to determine methods and procedures on new or special assignments

Engineering - Professional

Company Title	Engineer I	Engineer II	Senior Engineer I	Senior Engineer II	Principal Engineer	Senior Principal Engineer
Radford Level	Professional 1 (P1)	Professional 2 (P2)	Professional 3 (P3)	Professional 4 (P4)	Professional 5 (P5)	Professional 6 (P6)
Interaction and Collaboration	- Works under moderate guidance on process or project, collaborating primarily with peers and more experienced colleagues - Typically interacts with higher-level individual contributors - Beginning to gain trust of peers within engineering job family based on ability to accept and act on constructive feedback - Demonstrates common knowledge in collaboration, developing skills in communicating concepts and interacting with others	- Works under limited guidance on process or project, collaborating primarily with peers and more experienced colleagues - Begins to establish recognition as a resource within one's respective engineering/ technical group, collaborating regularly with peers - Typically interacts with higher-level individual contributors and managers - Demonstrates understanding of collaboration, exchanging ideas and content in a clear manner; explains complicated information	- Begins to establish recognition as a resource within one's respective engineering/ technical group, collaborating regularly with peers - Typically interacts with higher-level individual contributors and may begin to interact with peers - Begins to develop an internal network within The company based on demonstrated experience and collaboration - Explains complicated information and effectively lays out pros and cons of alternatives to consider	- Guides others to solve issues of diverse scope where analysis requires an understanding of current engineering or business requirements - Begins to interact with peers and other interdependent departments - Develops an internal network within The company, serving as respected technical subject matter expert within discipline based on specialized expertise and reliability - Communicates difficult concepts and negotiates within the function	- Leads and helps others to solve issues of diverse scope where analysis requires an understanding of current business trends - Interacts with peers, external and internal partners - Develops and maintains a robust internal network, serving as respected subject matter expert across The company based on industry expertise and reliability - Communicates difficult concepts to pave the way for a new project or program	- Serves as an industry leader and expert and creates formal networks with key decision makers - Consistently interacts with high-level individual contributors, management, and leadership - Strong internal and external network, relied upon heavily by leadership as technical expert able to solve unique problems - Influences the opinions and decision-making of others internally at the leadership level
Innovation and Creativity	- Initiates creative means to solve for overall processes, improvements, and efficiencies; begins to observe innovative approaches to cross-disciplinary processes - Begins to use judgment to deliver success	- Broadens creative means to solve for overall processes, improvements, and efficiencies; begins to focus on innovative approaches to cross-disciplinary processes - Begins to recognize the need for change and innovation, proactively using judgment to deliver success	- Consistently utilizes creative means to solve for process issues, developing innovative approaches to cross-disciplinary processes - Recognizes the need for change, creativity, and innovation within function and cross-functional disciplines; identifies problems and explores potential solutions	- Consistently and effectively utilizes creative means to solve for issues pertaining to processes and cross-disciplinary practices impacting department results; begins to be perceived as innovative "think-tank" for technical specialty - Begins to be recognized as champion; explores and approaches unconventional projects with an innovative mindset	- Expertly utilizes creative means to solve for varied complex issues across cross-disciplinary practices impacting function results; perceived within The company as the innovative "think-tank" for technical specialty - Executes strategic, innovative vision and encourages others to embrace creativity for The company to achieve breakthrough results	- Expertly utilizes creative means to solve for significantly complex issues across cross-disciplinary practices impacting organization-wide results; perceived both within The company and externally as the innovative "think-tank" for industry - In partnership with leadership, develops strategic, innovative vision and encourages others to embrace creativity for The company to achieve breakthrough results
Education / Experience <i>(Guideline only)</i>	Typically requires BS degree or equivalent experience	Typically requires BS degree + 2 years of related experience, or Masters + 0 years of related experience	Typically requires BS degree + 5 years of related experience, or Masters + 3 years of related experience, or PhD + 0 years of related experience	Typically requires BS degree + 8 years of related experience, or Masters + 6 years of related experience, or PhD + 3 years of related experience	Typically requires BS/BA degree + 12 years of related experience, or Masters + 9 years of related experience, or PhD + 5 years of related experience	- Typically requires BS/BA degree + 15 years of related experience, or Masters + 12 years of related experience, or PhD + 8 years of related experience - Demonstrated success managing large strategic company projects

Engineering - Professional

Company Title	Engineer I	Engineer II	Senior Engineer I	Senior Engineer II	Principal Engineer	Senior Principal Engineer
Radford Level	Professional 1 (P1)	Professional 2 (P2)	Professional 3 (P3)	Professional 4 (P4)	Professional 5 (P5)	Professional 6 (P6)
			▪ Demonstrated success with managing projects to successful completion	▪ Demonstrated success managing cross-functional and moderately complex projects to successful completion	▪ Demonstrated success managing large cross-functional complex projects to successful completion	and initiatives to successful completion

Management Leveling Guide

Detailed descriptions for each level

Company Title	Manager	Senior Manager	Associate Director	Director	Senior Director
Radford Level	Management 3 (M3)	Management 4 (M4)	Management 4.5 (M4.5)	Management 5 (M5)	Management 6 (M6)
Scope	- Manages operational tasks and transactional duties in support of scientific activities of discipline or sub-discipline - Experienced individual contributor; Works collaboratively across disciplines - Assists with and contributes to strategic planning - Assists process and policy improvement, timeliness, and performance requirements; contributes to the implementation of departmental strategic initiatives - Communicates elementary ideas and begins to drive scientific considerations and standards across disciplines	- Assists in the direction and control of the scientific activities of discipline or sub-discipline - May manage or guide a team of individual contributors; effectively collaborates across disciplines - Provides basic technical guidance for the successful management of scientific/ technical discipline - Provides input into process and policy improvement, timeliness, and performance requirements - Communicates moderately complex ideas and drives scientific considerations and standards across disciplines	- Assists in the direction and control of the scientific activities of discipline or sub-discipline - Manages or guides a team of individual contributors; promotes and models collaboration across disciplines; begins to lead development of team - Provides high-level technical expertise for the successful management of scientific/ technical discipline and contributes to strategic planning - Provides input into process and policy improvement, timeliness, and performance requirements; oversees the implementation of departmental strategic initiatives - Communicates complex ideas and begins to demonstrate leadership in driving scientific considerations and standards across disciplines	- Directs and controls the activities of a scientific/ technical discipline - May direct through first-line managers, responsible for development of managers and subject matter experts - Provides strategic leadership and technical expertise for the successful management of the of a scientific/ technical discipline - Effectively cascades functional strategy and contributes to development of The company policies - Responsible for enabling strategy, making final decisions on scientific matters to ensure achievement of functional goals - Demonstrates leadership in driving scientific considerations and standards across disciplines and with senior management	- Directs and controls the activities of a major of a scientific/technical discipline, or multiple of a scientific/ technical disciplines - Manages a team of directors and/ or high-level individual contributors, responsible for development of directors and subject matter experts - Ensures performance results and contributes to strategic planning for the larger function - Help drive the development of scientific strategy, vision and direction regarding issues that may have company-wide impact - Responsible for financial and people resource planning - Begins to influence the opinions and decision-making of others internally at the leadership level on critical scientific matters - Partners with leadership to translate scientific strategy into operational and talent development goals and drives implementation
Functional Knowledge	- Receives objective based assignments, and determines resources to meet schedules and goals - Recommends changes to policies and establishes procedures that affect section or multiple disciplines - Executes financials, business planning, organizational priorities and workforce	- Establishes operational objectives, policies, procedures and work plans and delegates assignments to subordinates - Develops, modifies and executes company policies that affect immediate operations and may also have company-wide effect - Accountable for department budget which may be broad and have far reaching impact on the business segment	- Requires comprehensive understanding of the underlying concepts in other disciplines and interdependent functions to best provide scientific expertise - Evaluates scientific challenges and completes complex, anomalous initiatives having functional area impact - Understanding of company structure including knowledge of how disciplines and functions interact with each other; understands how to leverage support from other parts of The company	- Applies in-depth knowledge of own function scientific-expertise to solve critical issues successfully and innovatively - Evaluates key scientific challenges and completes highly complex, anomalous initiatives having cross-discipline impact - Recognized as an internal subject matter expert and thought leader with extensive technical and scientific expertise and ability to translate business objectives into group priorities	- Requires in-depth scientific knowledge and ability to recognize interdependencies across a scientific/ technical discipline - Evaluates significantly complex key scientific challenges with leadership - Implements strategy, vision, and direction to scientific function - Recognized as an internal subject matter expert; may begin to be perceived as a "trusted advisor" across The company where guidance is sought from leadership within scientific expertise in times of change
Job Complexity	- Works on issues of diverse scope where analysis of situation or data requires evaluation of a variety of factors - Follows processes and operational policies in selecting methods and techniques for obtaining solutions	- Works on issues where analysis of situations or data requires conceptual thinking and in-depth knowledge of organizational objectives - Problems are not clearly defined and lack strategic direction	- Applies advanced research and industry knowledge to drive integrated results across multiple related disciplines; uses in-depth knowledge to implement complex innovative scientific solutions - Assesses the impact of a diverse scope of scientific problems; requires valuation of intangible	- Applies advanced analytical thought and judgment to identify and solve for highly complex issues; uses critical and innovative means to implement highly complex solutions - Directs the resolution of highly complex or unusual scientific problems that impact success or address future processes	- Applies advanced scientific analytical thought and judgment, solving for significantly complex issues - Directs the resolution of significantly complex or unusual scientific problems that impact long term success or address future processes - Partners with leadership to translate scientific strategy into operational and talent development

Company Title	Manager	Senior Manager	Associate Director	Director	Senior Director
Radford Level	Management 3 (M3)	Management 4 (M4)	Management 4.5 (M4.5)	Management 5 (M5)	Management 6 (M6)
	Develops and manages operational initiatives to deliver tactical results	- Implements policies and selects methods, techniques, and evaluation criteria for obtaining results - Drives the strategy and success of larger projects which contribute to multiple areas of the organization	- research data and relies on technical scientific expertise - Drives the success of larger scientific projects which contribute to multiple cross-disciplinary areas of the company	Partners with senior management in developing the strategy for the scientific/ technical discipline, directing the implementation of the research and tactical plans	goals and establishes metrics for assessing achievement
Leadership	- Manages the activities of multiple sections or a discipline through subordinate supervisors and/or professionals - Guides by function or department practices and well defines management precedents - May provide guidance to subordinates within the latitude of established company policies	- Manages activities of two or more disciplines or a department - May oversees more junior level professionals - Frequently advises team(s) on moderately complex matters	- Manages and guides the strategy of respective scientific/ technical discipline - May assist on planning, staffing, budgeting, managing expense priorities and implementing changes to scientific methods - Manages or guides a team of individual contributors	- Directs and controls the activities of the broader scientific/ technical discipline - Partners with senior management on the planning, staffing, budgeting, managing expense priorities, and recommending and implementing changes to scientific methods - May direct through subordinate managers and/ or senior scientific staff within the scientific/ technical discipline, responsible for development of team - Promotes cross-discipline positive working relationships (internal & external) though role modeling behavior	- Directs and controls the activities of multiple scientific/ technical disciplines - Begins to control planning, staffing, budgeting, managing expense priorities, and recommending and implementing changes to scientific methods - May direct through subordinate managers and/ or senior scientific staff within the scientific function; responsible for mentoring, team building, career guidance, growth and development opportunities and empower teams by example - Pursues and encourages the development of a learning culture across The company, inspires directors and managers to build and develop capabilities in others to meet strategic business objectives - Promotes and models culture and values that are consistent with the broader corporate values - Responsible for implementing and embodying the vision of the leadership team
Discretion and Decision Making	- Decisions impact others in the immediate team and influences methods and techniques - Erroneous decisions or failure to achieve results will add to costs and may have up to a one year impact	- Decisions directly impact short-term less than one-year results of the team/program/group - Erroneous decisions will result in critical delay(s) in schedules and/or unit operations and may jeopardize overall business activities	- Decisions will result in the successful delivery of projects, functional efficiency, and/ or improve the overall quality of respective scientific/ technical discipline - Begins to collaborate with scientific leaders to establish priorities, sets goals, and tracks outcomes - Makes decisions that have a medium-term to multi-year impact	- Decisions made impact overall success of respective scientific/ technical discipline - Through collaboration with cross-disciplinary scientific leaders, provides direction and assists in developing long-range plans that affect scientific function - Makes decisions on vendor management (e.g., choosing vendors, managing strategic engagement), contracts (pricing model, IP compliant), and KOLs - Makes decisions that have a long-term, multi-year impact	- Decisions directly impact achievement of scientific and other cross-functional goals with significant company-wide reach - Translates scientific plans to align with company-wide strategic goals and objectives of The company - Makes decisions on team structure, scope, and make-up; may require challenging decisions and implementation - Makes decisions that have a long-term or multi-year significant impact, has developing influence across The company

Management

Company Title	Manager	Senior Manager	Associate Director	Director	Senior Director
Radford Level	Management 3 (M3)	Management 4 (M4)	Management 4.5 (M4.5)	Management 5 (M5)	Management 6 (M6)
Interaction and Collaboration	- Partners with key contacts outside own area of expertise and other external stakeholders - Effectively communicates and presents results and recommendations across disciplines	- Interacts regularly with lower and/or senior management on matters concerning several functional areas, department, and/or customers - Requires the ability to persuade others in sensitive complex situations while preserving relationships - Applies knowledge to convince other stakeholders on desired departmental outcomes.	- Frequently interacts with senior management on scientific departmental matters; interaction typically consists of updates on projects or recommendations for decisions that require senior management approval - May interact with academia/ research, regulatory bodies and other external stakeholders influencing strategic scientific business results - Represents The company at conferences/ professional events and may present research findings - Promotes collaboration within interdisciplinary teams and works by The company's mission and vision	- Interactions frequently involve special skills, such as negotiating or attempting to influence senior management regarding policy and matters of significance to scientific/ technical discipline - Regularly interacts with academia/ research, regulatory bodies and other external stakeholders influencing and negotiating to drive scientific business results - Represents The company at conferences/ professional events and presents findings - Promotes collaboration within scientific/ technical discipline and encourages an environment where everyone can work by The company's mission and vision	- Interactions frequently involve special skills, such as negotiating or attempting to influence leadership regarding policy and matters of significance to the scientific function and The company overall - Partners with leadership team to provide cohesive direction towards The company's goals - Interacts extensively with academia/ research, regulatory bodies and other external stakeholders influencing and negotiating to drive strategic scientific and business results - Represents The company at professional events and presents findings; begins to be considered as a subject matter expert in the scientific field - Promotes collaboration across scientific/ technical disciplines and inspires an environment where everyone can work by The company's mission and vision
Innovation and Creativity	- Recognized as thought partner; explores approaches for improving scientific team engagement and management processes; assists with implementation of creative people management and team building methods - Consistently utilizes creative means to solve for elementary issues pertaining to scientific processes and cross-disciplinary practices impacting results - Begins to think about innovative ways to support the company's scientific function	- Begins to be recognized as champion; explores and develops approaches for improving scientific team engagement and management processes; assists with implementation of creative people management and team building methods - Consistently utilizes creative means to solve for moderately complex issues pertaining to scientific processes and cross-disciplinary practices impacting results - Contributes innovative ideas to appropriate functions	- Recognized as champion; explores and develops approaches for improving scientific team engagement and management processes; implements creative people management and team building methods - Consistently utilizes creative means to solve for complex issues pertaining to scientific processes and cross-disciplinary practices impacting results - Begins to be perceived as innovative "think-tank" for The company's scientific function	- Recognized as champion; explores and develops unconventional approaches for improving scientific team engagement and management processes - Consistently utilizes creative means to solve for diverse and highly complex issues pertaining to scientific processes and cross-disciplinary practices impacting results; develops creative people management and team building processes - Perceived as innovative "think-tank" for The company's scientific function	- Champions the implementation of strategic vision for innovation within the company-wide strategy, inspires others to embrace creativity, and begins to drive an innovative culture throughout The company - Utilizes creative means to solve for varied, significantly complex issues across cross-disciplinary practices impacting results - Recognized as innovative "think-tank" internally and begins to be recognized externally within the industry
