

Flagship Academy: *FSP Valuation Framework & Assumptions Pack*

May 14th, 2025

Presented by Strategic Business Operations & Analytics, Office of
the CEO, Flagship Academy

Overview of Our Discussion Today

- 1 **FSP Valuation Framework**
- 2 **Basics of DCF Modeling**
- 3 **Assumptions Pack Walkthrough**
- 4 **Valuation Model Repository**

Agenda

FSP Valuation Framework

Basics of DCF Modeling

Assumptions Pack Walkthrough

Valuation Model Repository

At FSP today, there are a few common types of modeling projects we do throughout the lifecycle of FSP Companies

Why we need a consistent modeling framework

Enable **comparisons** across analysis completed by different teams and different companies

Facilitate **regular review and discussion of key assumptions** to refine a “FSP view” that is aligned across our ecosystem

Ensure **decision-making integrity** in resource allocation, research prioritization, and risk assessment

Prevent **valuation distortion** to provide clear, comparable insights at RAC meetings

Build **confidence and creditability** with external stakeholders as FSP scales

Agenda

FSP Valuation Framework

Basics of DCF Modeling

Assumptions Pack Walkthrough

Valuation Model Repository

**“All models are wrong,
but some are useful”**

George E. P. Box, Statistician

While mathematical models cannot fully capture the complexity of the dynamic nature of the market, company and investors, they can still provide valuable insights if applied judiciously

Starry Night
Post-impressionism

Three Musicians
Synthetic cubism
Pablo Picasso

Discounted cash flow (DCF) model consists of four categories of assumptions that impact the resulting *risk-adjusted net present value (rNPV)*

3 4 Deep-dive to follow

1	2	3	4
Expected cash inflows	Cash outflows: Required investment	Time and the time value of money	Technical and regulatory risk
• Launch timing • Peak revenue (patient population, market share, price, duration of therapy) • Ramp to peak revenue • Loss of exclusivity • Deal economics	• Research & drug discovery • Clinical development • Manufacturing and cost of goods • Selling, general & administrative expenses	• Discount rate / Cost of capital • Similar idea as “inflation”	• Drug discovery and development carry additional risk which vary by stage • Multiple checkpoints along the way that could lead to different decisions being made

Source: adapted from Frank S. David, Seth Robey, and Andrew Matthews, *The Pharmagellan Guide to Biotech Forecasting and Valuation* (New York: Pharmagellan, LLC, 2017)

There are two types of discounts applied in DCF models

Time and the time value of money

In an rNPV calculation, we are **estimating our future cash flows** and then deciding **what that's worth to us today**

The further out the promised money is, the less valuable it is to us today

For example, a promise of \$260 in ten years is equal to being handed ~\$100 today

Technical and regulatory risk

In an rNPV calculation, we apply a “**probability of success**”(POS) discount to expected future cashflows, as each phase of the drug development process **carries different risks of failure**

The earlier the drug asset is, the lower the cumulative POS from its current stage to approval

For example, an asset currently in Phase 1 might only have a 10% POS that it will become a marketed product (vs. 20% POS if it's in Phase 2)

Source: adapted from Frank S. David, Seth Robey, and Andrew Matthews, *The Pharmagellan Guide to Biotech Forecasting and Valuation* (New York: Pharmagellan, LLC, 2017)

DCF models have similar structural mechanics

An oversimplified single asset model for illustrative purpose

1 Expected cashflow

2 Cash outflow

3 Time and the time value of money

4 Technical and regulatory risk

	Patent												Expire

The majority of time of building a good model should be dedicated on finding and vetting the right assumptions

Source: adapted from Frank S. David, Seth Robey, and Andrew Matthews, *The Pharmagellan Guide to Biotech Forecasting and Valuation* (New York: Pharmagellan, LLC, 2017)

General guidance on model building process

The Strategic Analytics team is available to answer any questions about the Assumptions Pack and valuation modeling—please reach out to Heng and Danielle (hlu@flagshippioneering.com, dhuang@flagshippioneering.com)

Key considerations before modeling

Non-exhaustive

To create purpose-build and audience-appropriate models

- Define the why, what, and who
 - **Why** are we creating the valuation model?
 - **What** are the key inputs and outputs?
 - **Who** is the audience?
- Align model complexity with the key question at hand
- Dedicate sufficient time and resources to **vet assumptions** that drive the model
- Keep the model's initial objectives and key assumptions front and center—must retest original assumptions when repurposing analysis for subsequent strategic decisions
- Financial models do not provide the answer but rather help us think through possible outcomes based on a set of decisions and beliefs

Agenda

FSP Valuation Framework

Basics of DCF Modeling

Assumptions Pack Walkthrough

Valuation Model Repository

Objectives of the Assumptions Pack

Overview of the Assumptions Pack

	Modules							
	1 Discount rates	2 PTRS ¹	3 Clinical trial parameters	4 Commercial assumptions (US)	5 Commercial cost structures	6 BD deal terms	7 Company exit opportunities	8 Biotech program reference
Key metrics	Discount rates, determined by tiering	- Probability of phase transitions by TA, indication and modality - PTRS from phase to approval	- Duration of phase - Recruitment time of clinical trials - Total cost of phase - Cost per patient in trial	- Peak sales by TA and indication - Time to peak sales - Revenue ramps	- COGS (including CMC) - SG&A - CapEx - Tax rate	- Deal value and upfront by modality, therapeutic area, and development stage - Milestones by development stage - Royalties	- Acquisition total deal value, upfronts, and milestones; by TA and development phase - IPO market cap	- Number of assets by development stage - Number of TAs - Deals / collaborations
Input type	Fixed assumption	Default assumption	Default assumption	Reference datapoints	Default assumption	Reference datapoints	Reference datapoints	Reference datapoints

Input type definitions

- **Fixed assumption** – all models must use this assumption
- **Default assumption** – deviations from default assumptions are expected to be explicitly noted
- **Reference datapoints** – model expected to have its own informed view for these assumptions, but reference datapoints are provided to help develop an informed view

Data source and methodology

● Deep-dive to follow

	Data source	Calculation methodology (if available)
1 Discount rates	Flagship internal assessment in collaboration with QLS	In consultation with QLS
2 PTRS	Internal assessment, EvaluatePharma	- Phase I to Filed PTRS are based on Evaluate Omnium, a ML tool that analyzes large data sets across the Evaluate Pharma database - Preclinical PTRS uses PM's standard assumptions
3 Clinical trial parameters	Internal assessment, EvaluatePharma	- Phase I to Filed PTRS are based on Evaluate Omnium, a ML tool that analyzes large data sets across the Evaluate Pharma database - Preclinical PTRS uses PM's standard assumptions
4 Commercial assumptions (US)	EvaluatePharma	- Peak sales are based on Evaluate Omnium, a ML tool that analyzes large data sets across the Evaluate Pharma database; sales are time-adjusted to today's value - Revenue ramp is a data pull from Evaluate Pharma: NME drug products launched between 2010-2014 were analyzed for their annual performance up to 2023 in the US; only NMEs that are small molecules and biologics are included in the analysis
5 Commercial cost structures	Internal assessment, EvaluatePharma, market research	- Asset-level reference is based on market research and FSP expert consensus - Company-level reference is a data pull from EvaluatePharma based on 2023 income statements of select biotechs
6 BD deal terms	Internal assessment, GlobalData, EvaluatePharm, Pitchbook	<i>Note that BD deal terms vary significantly depending on the context—please reach out to the FSP BD Team to align on any assumptions to be used in valuation models</i>
7 Company exit opportunities	Curated Acquisition Database, FactSet	- Acquisition data are from the Strategic Analytics Acquisition Database (1/1/24 to 11/30/24), focused on platform/therapeutic companies that have been acquired with an upfront value of >\$25M and can generate immediate liquidity for investors - Post-IPO data are from 2024 BioPharma IPO Tracker—FactSet and analysis by Capital Formation team
8 Biotech program reference	Market research	N/A

FSP standard tiered discount rate

Stage of asset in model	Single discount rate to be calculated using the below tiering
Preclinical	35%
Phase I	25%
Phase II	20%
Phase III	15%
Commercial	10%

Overall blended discount rate is similar to external models (i.e., 12-16%)

Why do we need tiered discount rates?

While PTRS accounts for *project risks* across development stages, the tiered discount rates are a catch-all for *business risks of the enterprise*; in other words, tiered discount rates aligned with development stages reflects the **evolving cost of capital of the enterprise, as project risks changes over time**

How do we arrive at these numbers?

As the project progresses, it becomes less risky to investors and the *expected return* decreases—in other words, **the tiered discount rates equate to the expected rate of return across the development stage** (i.e., investors expect higher rate of return for early-stage investments as they are taking on higher risks)

How to use the Assumptions Pack

- Review the default benchmarks and input reference
- Conduct further research with KOLs, both internal and external, to better triangulate for the specific purpose for valuation modeling
- Create a table that shows deviations from the default assumptions as part of the final output with rationale for any differences

This is a **living document** that is maintained by the Strategic Analytics team—we welcome feedback from the modeling community and will work with you to **refine what a “FSP view” looks like**

The next refresh will focus on **Preclinical Assumptions**

Deviation from the Assumptions Pack

Please take note of significant deviations from the FSP Default Assumptions and provide rationales

ASSUMPTIONS PACK

Sample Template: Deviations from the Assumptions Pack			
Key Assumptions (please list all deviations from <u>default assumptions</u> —e.g., PTRS, peak sales, cost structure)			
Assumption	Value chosen	Value in pack	Rationale for deviation
PTRS from DC to Approval	10%	5%	Platform allows for structurally higher success rates
Peak sales	\$2 B	\$613 mm	Unlocking new value pool not reflected in historical data
Profit margin - COGS - SG&A - Tax	Profit margin: 55% - COGS: 4% (SM) - SG&A: 20% - Tax: 21%	Profit margin: 44% - COGS: 10% (SM) - SG&A: 25% - Tax: 21%	New manufacturing techniques and we also believe we can create a very lean company with the novel technology, thus maximizing profit margin
Cumulative costs at first product - Platform development - Program development	...	\$1.5 bn	Examples of how this template might be filled out when presenting a company valuation using the assumptions pack.
Time to first product	...	13 years	
Capital needed until breakeven	...	\$2.6 bn

Agenda

FSP Valuation Framework

Basics of DCF Modeling

Assumptions Pack Walkthrough

Valuation Model Repository

We are working on creating a Model Repository

 Work in progress

The goal of the Model Repository is to provide **off-the-shelf, templated models** that FSP teams can leverage as a starting point to answer common key questions

Example: Company Valuation Model

Growth Team

Value Model Overview

Last Updated: May 2025
Growth Team

Table of Content

- Overview of Model
- Sample Outputs and Analyses

Purpose of the Value Model

The Value Model enables scenario-based planning for our portfolio companies by integrating program-level decision, milestone timing, partnering strategies and cash forecasting.

Example questions it can help answer:

- What is the total cash needed, when is the next raise, and what key value inflection points have been accomplished by then?
- What is the impact of partnering a program now vs. later (on cashflow and valuation)?
- What is the projected ROI for FSP and other investors? How much dilution do investors take under each plan?

The model takes into account three separate dimensions in order to inform the cash forecast

Key Model Inputs

Master Inputs (Across Scenarios)	
Category	Source
Discount Rate	Valuation Assumption Pack
PTRS	Valuation Assumption Pack + Company
Pre-Clinical R&D Timeline & Costs	Company
Clinical R&D Timeline & Costs	Valuation Assumption Pack
BD Deal Terms	Valuation Assumption Pack + BD Team
Peak Sales & Sales Ramp	Valuation Assumptions Pack
Company Level Costs (Platform, G&A, other fixed, etc)	Company
Commercial Cost Structure	Valuation Assumptions Pack

Scenario Level Inputs
Program Level: • Start date • Internally developed or partnered (and type of partnership) • Pause date (if paused)
Financing Inputs: • Raise amount and timing • Pre-money valuation • FSP investment

Sample Outputs and Analyses

\$80M + BD Deal #3																

Key Assumptions:
- Milestones and expenses are **not** risk adjusted; Not accounting for Debt repayment in 27/28 OR Accounts Payable

Substantial Value Creation potential over the next 2-4 years for new investors

rNPV by Scenario and Year

Note: rNPV analysis in the model is intended to help compare different scenarios and how the value changes over time, rather than provide a standalone valuation

rNPV relatively similar between Sc1 and Sc2, slightly lower for Sc3

Return on investment

Sc1 and Sc2 offer the highest returns for FSP

Investor Pitch Deck					
		Scenario 1 "2 Early BD Deals"	Scenario 2 "Investment Case"	Scenario 3 "Low BD Case"	Scenario 4 "Low Raise & BD Case"
Financing	Series B Ext	\$100M @ \$150 Valuation	\$100M @ \$150 Valuation	\$100M @ \$150 Valuation	\$80M @ \$150 Valuation
Ownership distribution	FSP	49%	49%	48%	52%
	Non-FSP	19%	19%	22%	24%
	NEW, Non-FSP	32%	32%		24%
Post-Money Valuation		\$250 M	\$250 M	\$300 M	\$230 M
2028	Valuation*	\$1.8 B	\$1.9 B	\$1.1 B	\$0.9 B
	FSP ROI	10 x	11 x	5 x	5 x
	Value Realization	\$0.8 B	\$0.8 B	\$0.5 B	\$0.4 B
2029	Valuation*	\$3.0 B	\$3.2 B		
	FSP ROI	18 x	20 x		
	Value Realization	\$1.4 B	\$1.5 B		

Key Assumptions:
 - Milestones and expenses are not risk adjusted; Not accounting for Debt repayment in 27/28 OR Accounts Payable
 - Sc3 assumes another raise of \$30M in Q4'26, \$10M from FSP @ \$400M
 - Sc4 assumes another raise of \$30M in Q2'26, \$10M from FSP @ \$200M
 * Valuation assumed at 40% discount rNPV

Can analyze from FSP perspective

High return opportunities for new Series B extension investors Comp' analysis being developed to support case

Investor Pitch Deck					
		Scenario 1 "2 Early BD Deals"	Scenario 2 "Investment Case"	Scenario 3 "Low BD Case"	Scenario 4 "Low Raise & BD Case"
Financing	Series B Ext	\$100M @ \$150 Valuation	\$100M @ \$150 Valuation	\$100M @ \$150 Valuation	\$80M @ \$150 Valuation
Ownership distribution	Series A / B Inv	68%	68%	70%	76%
	Series B ext Inv	32%	32%	30%	24%
Post-Money Valuation (B ext)		\$250 M	\$250 M		\$230 M
2028	Valuation*	\$1.8 B	\$1.9 B	\$1.1 B	\$0.9 B
	Series B ext ROI	6 x	7 x	3 x	3 x
	Value Realization	\$0.5 B	\$0.5 B	\$0.3 B	\$0.2 B

with us**

Appendix

Purpose of the value model

The Value Model enables scenario-based planning for our portfolio companies by integrating program-level decision, milestone timing, partnering strategies and cash forecasting.

Decision Area	Goal	Key questions
Scenario Planning	Quickly compare strategic paths	• What is the total cash needed and when is the next raise? • What are the key value inflection points and how far away are they (time + spend)? • Which scenarios deliver the best balance of value creation, risk and capital efficiency? • What is our base case vs. best / worst case value and cash need?
Program-Level Decisions	Prioritize and optimize the program portfolio	• What happens if we stop or partner a given program? • What is the impact of starting more programs vs. focusing on fewer? • Which programs drive the most value for the company and investors?
Partnering Strategy	Use partnerships strategically to manage risk and capital	• What is the impact of partnering a program now vs. later? • How does partnering affect our cash runway and need for new equity?
Cash Forecast & Fundraising	Ensure financial stability and minimize dilution	• When do we run out of cash under each scenario and what key milestones are hit within the time period? • How much do we need to raise, and at what valuation, to keep executing? • What is the minimal viable plan that avoids another raise before key milestones are hit?
Investor Value & ROI	Show the value preposition for different stakeholders	• What is the projected risk-adjusted NPV for each scenario? • What is the projected ROI for FSP and other investors? • How much dilution do current investors take under each plan? • Which scenario creates the strongest exit path?
